PROFESSIONAL SUMMARY

Software Engineer and M.S. Computer Science candidate (May 2026) with hands-on experience building high-availability backend services, AI-powered systems, and infrastructure automation. I write production Python and Go, work comfortably in Linux/Unix environments, and use AI pair-programming tools including Claude Code and GitHub Copilot every day. I have built AI agents that ingest telemetry and surface real-time insights, automated repetitive engineering workflows with LLM-based tooling, and managed cloud infrastructure with Terraform on AWS. I am curious about how complex systems fail, and I like building things that make on-call less painful for engineers.

EDUCATION

M.S. Computer Science | Syracuse University, Syracuse, NY

Aug 2024 – May 2026

Coursework: Distributed Systems, Cloud Computing, AI Systems, Machine Learning, Algorithm Design, Computer Networks

B.E. Information Technology | University of Mumbai, Mumbai, India

Aug 2019 – May 2023

EXPERIENCE

Software Engineer — SRE Tooling and Reliability

Jan 2026 – Present

iConsult Collaborative | Syracuse, NY

- Built and maintained high-availability backend services in Python and Go that integrate internal tools with broader platform ecosystems; used Terraform to manage serverless infrastructure on AWS and keep reliability tooling as resilient as the services it monitors.
- Built AI agents using LangChain and LangGraph that ingest system telemetry and surface real-time summaries and root-cause hypotheses for on-call engineers, cutting average time to identify incident cause from around 25 minutes to under 10 minutes across 3 client environments.
- Used Claude Code and GitHub Copilot daily to accelerate code reviews, generate test coverage for new reliability services, and replace roughly 4 hours per week of repetitive manual tasks with automated or AI-assisted workflows; verified all AI-generated code against security and quality standards before merging.
- Implemented prompt engineering workflows to assist in debugging complex system failures, generating structured runbooks, and producing technical documentation that the wider team actually reads and uses.

Software Engineer

Jan 2024 – Jul 2024

Vervali Systems | Mumbai, India

- Wrote production Python and Go services for a distributed SaaS platform with 10,000 active users on AWS; used Terraform for infrastructure as code across serverless and containerized workloads and kept deployments reliable through automated testing and CI/CD pipelines that cut release cycle time from about 2 hours to under 20 minutes.
- Built monitoring and alerting systems that caught around 35 production issues before users reported them over 6 months, and worked with senior engineers to implement automated root-cause analysis that reduced mean time to resolution by about 30%.
- Applied LLM-based tooling to automate log analysis and incident triage, which freed the on-call team from manually scanning logs during incidents and made post-mortems faster to write; used Git throughout with consistent branching practices and code reviews on every merge.

PROJECTS

Orange Bot — AI Agent for Real-Time Telemetry and Incident Context

Python · Go · LangGraph · LangChain · AWS · Terraform · Docker ·

Prometheus · Claude Code

- Built a multi-agent system in Python and Go that ingests telemetry data and provides on-call engineers with real-time summaries, historical context, and automated root-cause hypotheses; uses LangGraph for agent orchestration, Terraform for serverless infrastructure on AWS, and Claude Code throughout development to accelerate code quality and test coverage.
- Applied prompt engineering to help the agent generate structured incident summaries and triage recommendations from raw log data; validated all AI-generated outputs against accuracy and reliability standards before the system was put into use in a live environment.

H1B JobPilot — High-Availability AI Services Platform (In Progress)

Python · Go · Terraform · AWS Lambda · SQS · CloudWatch · Docker ·

Claude Code · GitHub Copilot

- Building a set of high-availability AI services in Python and Go managed entirely through Terraform on AWS, with Lambda functions, SQS queues, and CloudWatch monitoring to keep the system resilient; uses Claude Code and GitHub Copilot for pair programming and automated test generation, and validates all AI-generated infrastructure outputs before deployment.

Environmental IoT Reliability Pipeline

Python · Go · AWS · Terraform · Prometheus · Grafana · Docker · Linux · Git

- Built a real-time reliability monitoring pipeline in Python and Go on Linux that collects sensor telemetry, detects anomalies automatically, and surfaces alerts before they become incidents; managed all infrastructure with Terraform on AWS and built Grafana dashboards that give the team instant visibility into system health without digging through raw logs.

TECHNICAL SKILLS

Languages: Python, Go (Golang), Java, JavaScript (ES6+), TypeScript, SQL, Bash

SRE and Reliability: High-Availability Services, Incident Management, AIOps, Telemetry Ingestion, Root-Cause Analysis, On-call Tooling, Monitoring, Alerting, Runbook Automation, Prompt Engineering for Debugging

AI and LLM Tooling: Claude Code, GitHub Copilot, Amazon CodeWhisperer, LangChain, LangGraph, OpenAI API, Anthropic Claude API, RAG, AI Agent Development, LLM-based Workflow Automation

Infrastructure as Code: Terraform, CloudFormation, AWS Lambda, SQS, CloudWatch, EC2, S3, RDS, IAM, API Gateway, Serverless Architectures

Cloud and DevOps: AWS, GCP (familiar), Docker, Kubernetes, Prometheus, Grafana, GitHub Actions, Jenkins, CI/CD, Git, Linux/Unix

Databases: PostgreSQL, MongoDB, Redis, MySQL, DynamoDB

CERTIFICATIONS

AWS Certified AI Practitioner (AIF-C01) — Amazon Web Services

AWS Certified Developer – Associate — Amazon Web Services (In Progress)

Cisco Python Essentials I & II — Cisco Networking Academy

Cisco Data Science Essentials with Python — Cisco Networking Academy
